#prompt used:

.....

Annotate the following English sentences in CoNLL format. The POS column must be tagged using

the Universal Dependencies tagset. The CHUNK and NER columns must be tagged using the IOB tagging scheme.

Columns: TOKEN POS CHUNK NER

Sentences:

.....

#for this data I calculated:

--- POS Tagging ---

Accuracy = Correct Tokens / Total Tokens

Derivation: 590 / 1316 = 0.4483

--- Chunking (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=52 | FP=2

System Negative FN=949 | TN=204

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(52 + 204) / (1207) = 0.2121$

Precision = $TP / (TP + FP) = 52 / 54 = 0.9630$

Recall = $TP / (TP + FN) = 52 / 1001 = 0.0519$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.0986$

--- NER (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=3 | FP=5

System Negative FN=87 | TN=1112

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(3 + 1112) / (1207) = 0.9238$

Precision = $TP / (TP + FP) = 3 / 8 = 0.3750$

Recall = $TP / (TP + FN) = 3 / 90 = 0.0333$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.0612$

#observations:

1. Accuracy is very high but Recall is very less. The llm has not tagged the data unless it is sure about it's category. This might be an issue in prompting.
2. Punctuation token are missing. The llm might hae tokenised incorrectly.
3. NER data is tagged very poorly; this maybe due to lack of context.

#correcting discrepancies in llm generated dataset for english on few shot prompting

the DET B-NP O
flames NOUN I-NP O
. PUNCT O O

Now annotate the sentences:

.....

#for this data, I calculated:

--- POS Tagging ---

Accuracy = Correct Tokens / Total Tokens

Derivation: 965 / 1353 = 0.7132

--- Chunking (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=790 | FP=8

System Negative FN=243 | TN=179

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(790 + 179) / (1220) = 0.7943$

Precision = $TP / (TP + FP) = 790 / 798 = 0.9900$

Recall = $TP / (TP + FN) = 790 / 1033 = 0.7648$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.8629$

--- NER (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=17 | FP=9

System Negative FN=50 | TN=1142

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(17 + 1142) / (1218) = 0.9516$

Precision = $TP / (TP + FP) = 17 / 26 = 0.6538$

Recall = $TP / (TP + FN) = 17 / 67 = 0.2537$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.3656$

#observations:

1. Recall has gone up significantly as compared to zero-shot prompting. The llm is not tagging as conservatively as before.

2. NER tagging is better as well, but only when tagged NERs that appear more frequently.

3. There is major confusion between NER of loc and org; perhaps due to lack of context.

#correcting discrepancies in llm generated dataset for hindi on zero shot prompting

#prompts used:

.....

Annotate the following Hindi sentences in CoNLL format. The POS column must be tagged using the BIS (Bureau of Indian Standards) tagset. The CHUNK and NER columns must be tagged using the IOB tagging scheme.

Columns: TOKEN POS CHUNK NER

Sentences:

.....

#for this data I have calculated:

--- POS Tagging ---

Accuracy = Correct Tokens / Total Tokens

Derivation: 316 / 1036 = 0.3050

--- Chunking (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=340 | FP=18

System Negative FN=401 | TN=94

Derivations:

Accuracy = (TP + TN) / (TP + FP + TN + FN)

= (340 + 94) / (853) = 0.5088

Precision = TP / (TP + FP) = 340 / 358 = 0.9497

Recall = TP / (TP + FN) = 340 / 741 = 0.4588

F1 Score = 2 * Precision * Recall / (Precision + Recall) = 0.6187

--- NER (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=14 | FP=23

System Negative FN=22 | TN=792

Derivations:

Accuracy = (TP + TN) / (TP + FP + TN + FN)

= (14 + 792) / (851) = 0.9471

Precision = TP / (TP + FP) = 14 / 37 = 0.3784

Recall = TP / (TP + FN) = 14 / 36 = 0.3889

F1 Score = 2 * Precision * Recall / (Precision + Recall) = 0.3836

#obseravtions:

1. Instead of tagging the tokens provided, the llm is paraphrasing what is said instead.

In Sentence 6, the model essentially rewrote the sentence (" ...") rather than tagging the actual i

2. While the model occasionally gets PSP (Postposition) right, it often leaves the preceding noun untagged.

It seems to be following a more english influenced word order for tagging.

3. The precision is high but recall is low, suggesting it doesn't tag unless absolutely certain.

#correcting discrepancies in llm generated data for hindi on few shot prompting

Now annotate the given sentences:

.....

#for this data I have calculated:

--- POS Tagging ---

Accuracy = Correct Tokens / Total Tokens

Derivation: 148 / 843 = 0.1756

--- Chunking (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=233 | FP=34

System Negative FN=403 | TN=46

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(233 + 46) / (716) = 0.3897$

Precision = $TP / (TP + FP) = 233 / 267 = 0.8727$

Recall = $TP / (TP + FN) = 233 / 636 = 0.3664$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.5161$

--- NER (Binary: Non-O=Positive, O=Negative) ---

Confusion Matrix:

Gold Positive | Gold Negative

System Positive TP=10 | FP=130

System Negative FN=34 | TN=536

Derivations:

Accuracy = $(TP + TN) / (TP + FP + TN + FN)$

= $(10 + 536) / (710) = 0.7690$

Precision = $TP / (TP + FP) = 10 / 140 = 0.0714$

Recall = $TP / (TP + FN) = 10 / 44 = 0.2273$

F1 Score = $2 * Precision * Recall / (Precision + Recall) = 0.1087$

#observations:

1. Surprisingly after the few shot examples, the model seems to be hallucinating even more
2. We see a heavy concentration of [MISSING] tokens in Sentence 130 and 188, where the model skipped entire functional phrases.
3. NER precision is specific is very low.
