To be submitted by 24th oct 2026, should be done early so that edits can be made.

Objective: to create a detailed project proposal for the team course project for the course computational linguistics 2.

Contents: the project proposal should clearly define the goal of the project, the scope of the project, expected challenges and mitigation plan, tools used, our implementation plan, a rough timeline for creation of the project, clear division of the work equally among the 2 students Yashaswi and Baani, and the exact deliverables.

Important: we are learning computational linguistics 2. This course deals primarily with how we can solve problems where linguistic knowledge involving semantics and discourse is useful. We don't use neural networks, and we don’t wanna primarily evaluate pre-existing models. There should be some value that we are contributing. At the same time it shouldn't be too challenging a task. It should be doable but impressive, showing that we have applied what we have learnt in a creative manner.

Background of the students: we are a team of 2 students. We are 2nd years, doing undergraduate in btech and ms in computational linguistics. We have thus far had courses: introduction to linguistics(teaching us basics of morphology, phonology, syntax, semantics and pragmatics), computational linguistics 1 (solve problems where linguistic knowledge involving morphology, phonology, syntax is useful), language and society(sociolinguistics basics). We can use the knowledge gained here.

The subject: So far in the course we have implemented Basics of text corpora and word distribution (Zipf’s law), Simple language models and smoothing techniques, Document classification, Language identification ,Naive Bayes classification, logistics regression, Sentiment Analysis, Introduction to Binding Theory, Computational anaphora resolution algorithms, Rhetorical Structure Theory.

Resources shared by the TA: the files project-titles and project-guidelines contain sample projects and general instructions, go through both of them thoroughly.

Our first proposal: cl2_proj_proposal_preliminary contains our first project proposal. Basically, we planned to take knowledge data relevant to the medical field, and get it summarized by different methods and evaluate the results.

Why it was rejected: simply evaluating pre-existing models, none of our own input. No use of our linguistic knowledge. Human evaluation is too tricky to get done. Making our own summarizer too difficult.

Action statement: We must come up with a good project idea and proposal.
